

QUERY MANAGEMENT REPORT

Study: NCT06890338, Combination Therapy for Advanced Ovarian Cancer

Prepared by: Sunday Faith Moses, Clinical and Drug Data Analyst

1. PURPOSE

This document provides a formal summary of data queries raised during the monitoring review of clinical trial NCT06890338. It captures query status, site responses, and resolution actions to support data quality assurance and audit readiness in accordance with ICH E6(R2) GCP guidelines.

2. QUERY SUMMARY TABLE

Status	Count
Total Queries Raised	15
Closed	8
Open	4
Pending	2
Overdue	1
Resolution Rate	53%

3. OUTSTANDING QUERIES REQUIRING IMMEDIATE ACTION

- **QM-003 — Informed Consent Violation (PT-005)**

Participant enrolled using superseded ICF version 1.0. Re-consent using current version 1.1 required immediately. Risk: protocol deviation if unresolved before next monitoring visit.

- **QM-007 — SAE Reporting Delay (PT-013)**

Serious adverse event (dyspnoea) not reported to sponsor within the 24-hour protocol requirement. Immediate escalation to sponsor and regulatory team required.

- **QM-012 — Missing Witness Signature (PT-023)**

Witness signature absent from informed consent form for a participant who required assistance during the consent process. Re-consent with witness required before next study visit.

- **QM-015 — Biomarker Assay at Non-Approved Laboratory (PT-029)**

FRα biomarker test performed at a local laboratory not approved per protocol. Central laboratory repeat testing required to confirm participant eligibility.

4. QUERY RESOLUTION ANALYSIS

Of the 15 queries raised during this review period, 8 were resolved within the agreed service level agreement of 5 business days. The most common query categories were Missing Data (6 queries) and AE Reporting (3 queries), suggesting targeted site training on adverse event documentation procedures may reduce future query volume.

Four queries remain open with no site response received. Escalation to the Principal Investigator is recommended if responses are not received within 48 hours.

5. RECOMMENDATIONS

- Escalate QM-003, QM-007, QM-012, and QM-015 to Principal Investigator immediately
- Schedule site retraining on AE reporting timelines and ICF procedures
- Implement automated eCRF validation checks to reduce missing data queries
- Set 48-hour response SLA reminder for all open queries
- Review visit scheduling procedures to prevent recurrence of QM-013 overdue assessment

6. CONCLUSION

This query management report reflects the current data quality status of NCT06890338 as of January 2024. Immediate action is required on four outstanding queries to maintain protocol compliance and audit readiness. The Clinical Data Management team will conduct a follow-up review in 14 days.
